

AI Gym

The gym runs on a notebook. We replace the notebook.

Member management, coaching on the floor, and an AI training assistant — built for Lebanese gyms. Working product, live today.

triple-a.up.railway.app • Triple A Gym, Aaramoun, Lebanon

THE PROBLEM

A gym owner runs a real business on paper

1

Money leaks quietly

Dues are tracked in a notebook. Members lapse and nobody notices until the month is over.

2

Members leave silently

No one sees that a member stopped coming three weeks ago — until they are gone for good.

3

The coach carries it all in his head

Last session's weights, who is injured, who paid. Written on paper, or not at all.

4

Existing software does not fit

Priced for a US gym on fibre, English-only, and useless during a power cut.

WHY NOW

Three things became true at once

1

Every member has WhatsApp

Messaging is solved and free. No SMS cost, no app install to reach a member.

2

AI got cheap enough

A per-member training and nutrition plan used to need a human hour. Now it needs a few cents and a coach's approval.

3

Phones replaced desktops

The gym floor never had a computer. Every coach and member already carries the device.

None of this was true when the incumbents were designed. They are desktop-era products with a phone app bolted on.

THE PRODUCT

One app, three people, one gym

MANAGER

On a phone

- Register a member in under a minute
- Who owes money, and how much
- Who stopped coming — before they churn
- WhatsApp reminders, one tap, in Arabic

COACH

On an iPad, on the floor

- Who is in the gym right now
- Unpaid dues and injuries, before the session
- Sets, reps, weight and machine — tap, never type
- How the member handled it

MEMBER

On their own phone

- Today's workout and the coach's videos
- Calendar and booking with a coach
- Food by photo, water, supplements
- Two AI assistants to ask

Built for the conditions, not translated into them

1

Works through a power cut

Writes queue on the device and sync when the connection returns. A generator restarting mid-session never loses a logged set.

2

Arabic is a first language

Not a translation layer. Right-to-left throughout, in the Arabic a gym manager actually speaks.

3

Runs on a cheap Android

Under 200 KB of JavaScript, enforced on every build. Loads on the phone members already own.

4

Priced for a Beirut gym

The incumbents cost more per month than many gyms can justify. Our competition is a notebook, and we price against what it loses them.

The coach stays in charge — by design

What the AI does

- Builds a plan from body data, lifestyle and injuries
- Estimates a meal from a photo
- Answers the member's questions, day or night
- Logs the food the member reports

What it is never allowed to do

Change a training programme or a calorie target. Those become a draft the coach approves — enforced in code, not by asking the model politely.

Why an investor should care

It is the difference between a tool coaches adopt and one they quietly sabotage. An assistant that rewrites programmes competes with the coach; ours makes him look good.

Progress photos are private by default, and sharing is per-photo and explicit.

COMPETITION

Nobody is serving this market

Trainerize

from ~\$248 / mo

Integrations and scale. Check-in forms widely reported as fragmented; coaches still export to other tools.

Everfit

from ~\$105 / mo

Best single-app client experience and multi-language. Still cloud-only, still priced for a Western studio.

TrueCoach

1:1 up to ~50 clients

Simple and well liked, but built for a solo online coach, not a gym floor.

A notebook + WhatsApp
group
free

The actual incumbent in Lebanon, and the one we have to beat.

Pricing as listed publicly, 2026. Real bills commonly run higher once nutrition, automation and branding are added.

BUSINESS MODEL

A monthly subscription per gym

[FILL: price / gym / mo]

Target price point

[FILL: gyms in Lebanon]

Reachable market

[FILL: pilot gyms signed]

Committed today

How the price is justified

We do not sell features against Trainerize — we sell recovered money against a notebook. A gym that collects a handful of lapsed memberships it would otherwise have lost has paid for the year. That framing is why the guarantee on the next slide is affordable.

Member payments are tracked, not processed — no card rails, no PCI scope, no payment-provider dependency in v1.

Prove it in our own gym, then sell next door

The offer

Live in 48 hours. We import your members from your notebook ourselves. Your staff tap; they never type.

The guarantee

"If it does not recover more in missed dues than we charge you in the first 90 days, you do not pay."

1

30 days

Run Triple A entirely on the app. Measure collection rate, lapsed members and signup time — before and after.

2

60 days

Three to five paying pilot gyms nearby. Warm outreach and in-person visits, not ads — the market is small enough to walk.

3

90 days

Case study from our own gym plus pilot numbers. That is the traction slide, and the point at which raising makes sense.

What is true today — and what is not yet

Built and live

- Working product, deployed and in use for testing
- All three surfaces complete, English and Arabic
- AI assistants with coach approval built in
- One gym ready to run on it: Triple A, Aaramoun

Not yet proven

- Paying gyms: [FILL: 0 today — target 3-5 by day 60]
- Members managed: [FILL: count once Triple A is live on it]
- Collection rate change: [FILL: before vs after, 30 days]
- Lapsed members recovered: [FILL: count over 30 days]

These numbers are deliberately blank. They are 30 days of real usage away, and inventing them is the fastest way to lose a room.

ROADMAP

From one gym to many

NOW

**Working prototype,
live**

Three surfaces, both languages,
deployed

NEXT

Real backend

Accounts, per-gym data
isolation, offline sync

THEN

AI in production

Plan generation, safety
guardrails, evals in CI

AFTER

Sell it

Self-serve signup, gym billing,
owner analytics

Payment processing is deliberately late: Stripe does not support Lebanese businesses, so gym billing runs on local rails until that is worth solving properly.

TEAM

Operators, not just builders

Kassem Shehady

Founder

[FILL: background, and your role at the gym]

The unfair advantage

We own a gym. Triple A in Aaramoun is the first customer, the test lab and the case study — with coaches Karim, Abed and Assaf using it daily. Most founders in this category have to guess what a gym floor needs; we watch it every evening.

Raising [FILL: amount] to reach [FILL: milestone]

1

Product

[FILL: %]

Backend, offline sync, AI in production

2

Go to market

[FILL: %]

Pilot gyms, onboarding, case studies

3

Runway

[FILL: months]

To paying gyms and repeatable sales

APPENDIX

Sources and what is real

- Competitor pricing: Everfit and Trainerize public pricing pages and 2026 comparison reviews (fitbudd.com, blog.everfit.io, trainerize.com).
- Market positioning: Glofox "best gym management software 2026"; Gymdesk Mindbody alternatives; Zen Planner kiosk documentation.
- AI fitness landscape: 2026 reviews of Fitbod, Freeletics, Trainera (sensai.fit, rizin.app).
- Product claims in this deck describe software that is built and deployed — every screen shown exists and runs.
- Any figure marked [FILL: ...] is a number we have not measured yet. It is left blank on purpose rather than estimated.
